

Product Requirements Document

TravelApp (temporary name)

[Short description]

Field	Details
Product / Feature Name	[Enter product or feature name]
Document Owner	[Name, role]
Status	[Draft / In Review / Approved]
Version	[v0.1]
Last Updated	[Date]
Platforms	[Web, iOS, Android]

Executive Summary

Summarize in a few sentences what this product/feature is, why it matters, and who it's for. Should be understandable by someone outside the immediate team.
[Add detail here]

Problem Statement

Planning a trip is an exercise in app juggling: research lives in chats, itineraries in spreadsheets, and navigation in map apps. Travelers lack a unified platform that acts as a single source of truth for all trip-related data—including flights, accommodations, transportation, weather forecasts, maps, dining, and activity recommendations. This fragmentation creates significant hurdles throughout the trip lifecycle:

1. Tool Fragmentation & Context Switching

Travelers must cobble together disparate tools to organize a single trip—using maps for geography, sheets for itineraries, messaging apps for collaboration, and various apps for weather and safety alerts. This forces manual, redundant effort to consolidate information, and makes it impossible to maintain a cohesive plan that is accessible at a glance.

2. The "Planning vs. Execution" Usability Gap

While planning often happens on desktop, execution happens on mobile, often in challenging environments with limited connectivity. Current tools fail to offer robust offline support, leaving travelers stranded without vital itinerary or navigation details when they lack internet access. Furthermore, mobile interfaces often struggle to display complex, "desktop-first" planning documents, forcing clunky, error-prone navigation while on the move.

3. Collaborative & Social Friction

Sharing trip plans remain disjointed, often buried in long-form messaging threads or static emails. Coordinating changes, tracking shared expenses (and the associated pay-back calculations), and managing real-time location sharing during the trip creates logistical friction and social tension. A unified platform is needed to manage these group dynamics seamlessly.

4. Lack of Dynamic & Contextual Intelligence

Travelers currently operate with static plans that cannot adapt to the real world. They lack access to:

- **Dynamic Route Planning:** Tools that don't just list stops, but factor in drive times, daily limits, and accommodation needs.
- **Real-Time Intelligence:** Proactive, AI-generated recommendations based on user preferences, current weather, and local events (e.g., road closures, wildfires, accidents).
- **Fluid Adjustment:** The ability to adjust routes and plans on the fly without needing to manually reconstruct the entire itinerary.

Target Platforms

We are targeting three primary platforms to ensure a seamless experience across devices:

1. **Web App:** A robust interface for deep planning, trip configuration, and data management.
2. **Android App:** A mobile-first companion for execution, real-time navigation, and on-the-go updates.
3. **iPhone App:** A mobile-first companion for execution, real-time navigation, and on-the-go updates.

Goals & Objectives

User Journeys

To understand the end-to-end experience, we have identified four core user journeys:

1. **Planning & Preparation:** The initial discovery and collaborative phase where users research destinations, build the itinerary, and manage bookings.
2. **In-Transit / Execution:** The active travel phase where users rely on real-time navigation, live updates, and offline access to execute the plan.
3. **On-Trip Management:** The daily experience during the trip, including collaborative updates, expense tracking, and real-time social/location sharing.
4. **Post-Trip Reflection & Archiving:** Capturing actuals vs. plans, finalizing expense splits, and storing trip memories or data for future reference.

User Experience & Design

Appendix

Current Tools & Solutions Ecosystem

- **Navigation & Mapping (e.g., Google Maps):** Route optimization, discovery and recommendations (lodging, points of interest, dining), real-time location sharing, and turn-by-turn navigation.
- **Email Clients (e.g., Gmail):** Central repository for travel confirmation details, including flights, hotel reservations, and rental car bookings.
- **Note-Taking Applications (e.g., Google Keep):** Capturing quick notes, lists, and informal recommendations for accommodations, activities, and dining.
- **Documents & Spreadsheets (e.g., Google Docs, Google Sheets):** Custom itinerary creation, budget management, and structured trip tracking.
- **Social Platforms (e.g., Facebook, Instagram):** Crowdsourced recommendations and travel inspiration for attractions, dining, and accommodations.
- **Messaging & Communication (e.g., WhatsApp, iMessage):** Direct communication, group coordination, and ad-hoc sharing of locations, itineraries, and travel ideas.
- **Weather Services:** Monitoring destination forecasts and climate conditions.
- **Rideshare Services:** Local transportation and point-to-point transit booking.

Market Landscape & Core Competitors

1. [Wanderlog](#)
 - **Core Value:** The closest product to a 'Google Docs for travel'. It combines chronological day-by-day itineraries with a live interactive map.

- **Functionality:** Users can drop places of interest onto a map, optimize routes, collaborate live with friends, and manage travel budgets.
 - **Platform:** Comprehensive data syncing across Web, iOS, and Android.
 - **Pricing:** Freemium. The core itinerary mapping, editing, and group collaboration features are entirely free. The Pro tier unlocks offline access, auto-forwarding for emails, and direct export capabilities to Google Maps.
2. [Triplt](#)
- **Core Value:** Unmatched master itinerary automation for frequent and business travelers.
 - **Functionality:** It scans a user's linked inbox or processes forwarded flight, hotel, and rental car confirmation emails to instantly compile a chronologically sorted trip.
 - **Platform:** Highly optimized Web dashboard, iOS, and Android applications.
 - **Pricing:** Freemium. Seamless automated email parsing and basic chronological timelines are free. The premium Triplt Pro subscription adds real-time flight delay alerts, terminal gate changes, and alternate flight finder tools.
